

Hurricanes

Every year, hurricanes hit some part of the world. Large areas are damaged. Sometimes people, animals, and houses are harmed. Even trees are affected by hurricanes. One kind of tree that can be badly hurt is the oak.

Oak trees can survive the terrible winds of hurricanes. But they cannot stand in water for too long. Their roots need air. Without oxygen, the trees do not get the nutrition they need.

As areas hit by hurricanes begin to recover, the trees try to recover, too. It takes time to learn which trees will survive.
